

Passage of an electromagnetic wave ...

S/058/62/000/003/051/092
A061/A101

of dipole vibration amplitudes of the particles of the crystal lattice. The vibrations are determined by a system of equations with their number equaling the product of the lattice planes by the number of particles in each lattice cell. It is assumed that, in addition to the incident wave, also those waves emitted by all crystal plate particles act upon each radiant dipole of the crystal lattice.

TITLE: Passage of X-rays through a plane parallel crystal plate under general conditions

PERIODICAL: Referativnyy zhurnal, Fizika, no. 3, 1962, 6, abstract 3G38 ("Izv. Fiz. in-t s ANEB", 1960, v. 8, 249-266. Bulgarian; Russian, German summaries)

TEXT: The system of equations presented in an earlier paper (abstract 3G23) is solved by approximation for the limiting case of small wavelengths. In particular, the shape of the electromagnetic field before and behind the plate possesses properties of the field of diffraction from the crystal lattice. The directions of the maximum intensities of the scattered waves satisfy the well-known Laue conditions.

Abstract: Describes the various types of trees in this species
and the locations in Rumania where they occur. The importance
of the tree is that it is a major source of nectar for bees.
The characteristics of lime nectar and honey are given.

Includes a table showing the major species of lime trees
from the point of view of nectar production and 5 references,
of which 2 Russian, 2 Rumanian and 1 German.

TITLE: Indium-gallium alloy as a γ -carrier for radiation circuits

SOURCE: Atomnaya energiya, v. 19, no. 2, 1965, 178

TOPIC TAGS: reactor, carrier, gamma carrier, radiation circuit, indium gallium alloy, indium, gallium

ABSTRACT: The Institute of Physics, Georgian Academy of Sciences, has used an In-Ga alloy containing 24.5 wt% In as a γ -carrier for the radiation circuit of an IRT-2000 reactor! After 1000 hr operation it was found that the In content in the alloy decreased by 2 wt%. An indium-base solid phase was found in the circuit joints. Thus, In-Ga alloy with 24.5 wt% In is unstable and contains excessive In. Laboratory tests and tests under production conditions with another alloy containing 22.5% In produced similar results. Only alloy with 20.5 wt% In was found to be suitable as a γ -carrier for radiation circuits at temperatures as low as 130°. This alloy has a viscosity of $2.5 \cdot 10^{-2}$ P at room temperature and a density of 6.3 g/cm³. [WW]

V 2684. Diphenylcarbazone as a reagent for the
colorimetric determination of germanium. G. S.

Desmuk (Zh. Anal. Khim., SSSR, 11(6), 10-11
61-62).—Addition of a drop of a saturated alcoholic
solution of diphenylcarbazone to the yellow ger-
manium-molybdate complex gives a purple colour
similar to that in the reaction for Hg. The colour
with Hg, as also the red colour given by diphenyl-
carbazone and ammonium molybdate, is destroyed
on the addition of conc. HCl or H_2SO_4 , but the
colour of the germanium complex changes to deep
blue, which is stable even in the presence of excess
of acid. When ammonium molybdate solution is
acidified before addition of a GaO_4 solution, or a
neutralised sodium germanate solution is used, the
blue colour is not produced. The reaction with
diphenylcarbazone is sensitive to 0.1 mg of Ge in
0.03 ml.

Cold Upsetting of Slotted Screws (Khолодная вдавка винтов со слотами)

PERIODICAL:

Mashinostroitel', 1958, Nr 10, pp 1 - 3 (USSR)

ABSTRACT:

The Leningradskiy instrumental'nyy zavod (Leningrad Tool Plant) has introduced cold upsetting of M2.3x4 and M3x5.3 slotted screws on a two-stroke AA 120 automatic machine with a design change of the cutting tool. The machine has an output of 150 parts a minute at a minimum length of 12 mm for the blanks. In the case of the M2.3x4 screw, the blank must be 9 mm long. A speed of the upsetting dies equalling 300 operations a minute proved to be too fast since a heat was developed that affected the life of the die. With 150 double strokes a minute of the slide, a yield of 75 parts a minute is achieved which does not adversely affect the life of the die and provides a stable operation of the machine. The upsetting wire for upsetting of slotted screws is made of steel of "marks" 10 to 15. The wire resistance

Card 1/2

Cold Upsetting of Slotted Screws

SGV-117-58-10-2/35

should be 45 to 55 kg per square cm. The preliminary dies are made of U8A, U10A and Kh12F1 steel. Those made of the latter proved to have the highest stability. Since the finishing dies will not take more than 10,000 to 15,000 blows, only cold plastic deformation of these dies was found as suitable method to overcome this difficulty. There are 6 sets of diagrams.

Devov, A.Y.E.

Rapid-setting concrete. A. E. Devov. Shrovet. Prom.
33, No. 10, 30-2(1955). Effect of pouring time was detd.

on 7% gypsum concrete made with cement beginning to set
in 22 min. Poured directly, after one, and after one and
one-half hrs. it showed crushing strength after 24 hrs. of
232, 254, and 276 kg./sq. cm., resp., thus recommending a
somewhat slower pouring time. The water-cement ratio
has a pronounced effect on this strength; increase thereof
from 0.6 to 0.8 cuts the crushing strength in half. Addition
of gypsum renders concrete fully low-temp. resistant but does
not cause any corrosion. Gypsum causes a certain expansion
of concrete, but the pattern of the latter is not a direct
function of the concentration. J. D. Gat

AUTHOR: Desov, A. Ye.

TITLE: How the Mechanics of Viscoelastic Plastic Media Can Be Used to Solve Problems Relative to the Forming of Reinforced-concrete Structural Members (Puti primeneniya mekhaniki uprugo-vyazko-plastichnykh sred k resheniyu zadach o formovanii zhelezobetonnykh elementov)

PERIODICAL: V sb.: Issledovaniye prochnosti, plastichnosti i polzuchesti stroit. materialov. Moscow, 1955, pp 138-169

ABSTRACT: The author analyzes the principal ways of forming concrete in terms of concepts belonging to the mechanics of viscoelastic plastic media. He examines the apparent viscosity of concrete, its shear-stress plastic limit, its instantaneous modulus of elasticity, and its relaxation time, deeming these to be its basic structural-mechanical characteristics. Included is a schematic diagram of a ball-type vibroviscosimeter which the author proposes, and graphs are displayed showing the influence on the apparent viscosity and other mechanical properties of concrete mixes exerted by such factors as the vibration frequency and

Card 1/2

SOV/124-57-5-6093

How the Mechanics of Viscoelastic Plastic Media Can Be Used to Solve (cont.)

amplitude, the water-cement ratio, and the type and quantity of plasticizing agents used. The author examines also problems relative to the vibrational tamping and rolling of reinforced-concrete members. An account is given of a dynamic method for determining the instantaneous elasticity modulus E_0 and relaxation time T for a medium the state of which is describable by the equation

$$E_0 T \dot{\epsilon} + E \epsilon = T \dot{\sigma} + \sigma$$

wherein E is the long-term elasticity modulus, σ is the stress, and ϵ is the strain observed. Experimentally determined values for E_0 and T are included. Bibliography: 27 references.

Title : Radiation Protection

Orig Pub: Stroit. prom-st, 1956, No 2, 28-31

Abstract: The absorption coefficient for Co^{60} γ -radiation has been measured for five concrete compositions using heavy fillers and for cast iron; 75 by 75 by 10 cm and 75 by 75 by 3 cm slabs were irradiated with γ -rays from a type GUP-50 apparatus (20 gm-equiv. Ra) in two ways, using a broad and a narrow beam. It has been established that when a narrow beam (diameter of the diaphragm, 10-12 mm) is used the intensity of the radiation decreases more rapidly than when a broad beam is used. The absorption coefficient (in cm^{-1}) for narrow and broad beams are as follows: cast iron, 0.42 and 0.289; concrete with various fillers: limonite and

TITLE: Some problems concerning the technology of heavy concretes for protection against radioactivity effects

SOURCE: Akademiya stroitel'stva i arkhitektury SSSR. Institut betona i zhelezobetona, Perovo. Trudy, no. 29. Moscow, 1962. Tekhnologiya i svoystva tyazhelykh betonov, 4 - 36

TEXT: Data are given concerning the shielding properties of special concretes made from flue dust, limonite, serpentinite, magnetite, and hydro-goethite ore with cast-iron shot and boron carbide additions. Results: The strength of flue-dust concrete is somewhat higher than that of limonite concrete. The moisture loss at 18 - 20°C for concretes made from two Portland cements is 3% for magnetite concrete, 5% for serpentinite concrete, and 7% for magnetite concrete with flue dust. For concretes prepared from gypsum plaster-aluminous cement it is much less: 2% in case of magnetite concrete with flue dust. Losses in

Card 1/2 ~

S/600/62/000/029/001/001

A061/A126

Some problems concerning the technology of

weight of limonite concrete with shot and boron-carbide additions are 3. - 3.8% at 18°C, 4.5 - 5.6% at 100°C, 5.4 - 5.8% at 150°C, and 5.9 - 6.4% at 200°C. The composition-dependent strength drop of special concretes, determined on cubic samples, was contained within 24 - 38% at temperatures up to 200°C. The strength values determined on prismatic samples dropped more sharply. Magnetite and serpentinite concretes displayed a shrinkage of 700 - 1,000 μ/m, and flue-dust concrete one of 1,200 μ/m, after 28 days. The shrinkage of limonite concrete with additions varied between 450 and 850 μ/m, depending on the type of cement used. Concretes with additions of cadmium and barium salts did not show losses in strength after a 100-day irradiation with Co⁶⁰ (activity 2.5 gram-equivalent of radium). The addition of 2% cadmium chloride and barium sulfate to Portland cement concretes did not produce any corrosion on the reinforcement of both irradiated and non-irradiated samples. Intense corrosion was produced on the reinforcement by an addition of 2% cadmium sulfate even before irradiation. This effect was also observed in gypsum plaster-aluminous cement concretes both with and without cadmium and barium salt additions. There are 10 figures and 22 tables.
